STAT

Under separate cover three rolls of multispectral imagery of several U. S. locations were forwarded to your Center. Mr. [redacted] has this material in his custody. The locations are Baton Rouge, La., Point Comfort, Tex., and Mechanicsburg, Pa. The material includes rolls of positive transparencies of aerial Ektachrome, Color IR, Thermal IR, and 4- Hasellblad multispectral photography. The multispectral data is of particular interest in that it would be very helpful to us in furthering our investigation of spectral signatures of certain images contained therein. Work so undertaken is in cooperation with the NASA Earth Resources Aircraft Program from which source these data come.

STAT

Specifically, it would be very much appreciated if microdensitometer traces and readings could be made on the specific areas delineated to [redacted], and the tracings with density values forwarded to me. Additional suggestions for improving the analysis would also be very helpful.

STAT

This imagery, as well as the color and thermal data, contain, I believe, other information of some interest to your organization and, for that reason, I am most happy to make it available for your internal use as you may see fit. Since an investigation report for NASA is required in the near future, would two or three weeks over your way be adequate for your use?
